

Geant4 release 9.6+P02

ELECTROMAGNETIC PHYSICS

LOW ENERGY CATEGORY

October 10-11, 2013 – Bordeaux, France

Content

2

- Context
- Physics **processes & models**
 - **Livermore**, including polarized photon models
 - **Penelope** models
 - **Ion ICRU'73** model
 - **Geant4-DNA** processes and models
 - **MuElec** processes and models
 - **Monash U.** models
 - **Atomic de-excitation** process and models
- How to implement a Physics list ?
- Documentation

Context

Purpose

4

- Extend the coverage of Geant4 electromagnetic interactions with matter
 - ▣ for photons, electrons, positrons and ions
 - ▣ down to very low energies (sub-keV scale)

- Possible domains of applications
 - ▣ Space science
 - ▣ Medical physics
 - ▣ Underground physics
 - ▣ Microdosimetry for radiobiology and microelectronics
 - ▣ ...

- Choices of physics models include
 - ▣ Livermore : electrons and photons [250 eV – 1 GeV]
 - ▣ Penelope : electrons, positrons and photons [100 eV – 1 GeV]
 - ▣ Microdosimetry models
 - Geant4-DNA project: [eV – ~ few 100 MeV]
 - MuElec for Silicon : [eV – 1 GeV/u]

Software design

5

- Identical to the software design proposed by the **Standard EM working group**
 - ▣ Applicable to **all** low energy electromagnetic software classes
 - ▣ Allows a **coherent approach** to the modelling of **all** electromagnetic interactions

- A **physical interaction** or **process** is described by a **PROCESS CLASS**
 - ▣ Naming scheme : « G4**ProcessName** »
 - ▣ Eg. : « G4**ComptonScattering** » for photon Compton scattering

- A physical process can be simulated according to **several models**, each model being described by a **MODEL CLASS**
 - ▣ Naming scheme : « G4**ModelNameProcessName**Model »
 - ▣ Eg. : « G4**LivermoreCompton**Model » for the Livermore Compton model
 - ▣ Models can be alternative and/or complementary in certain energy ranges

- According to the selected model, model classes provide the computation of
 - ▣ the process **total cross section** & the **stopping power**
 - ▣ the process **final state** (kinematics, production of secondaries...)

- All required data files are located in the **\$G4LEDATA** directory

Physics 1 / 7

Livermore models

Livermore models

7

- Full set of models for **electrons** and **gammas**

- Based on publicly available **evaluated data tables** from the Livermore data library
 - **EADL** : Evaluated **Atomic** Data Library
 - **EEDL** : Evaluated **Electrons** Data Library
 - **EPDL97** : Evaluated **Photons** Data Library
 - Mixture of experiments and theories
 - Binding energies: **Scofield**

- Data tables are **interpolated** by Livermore model classes to compute
 - Total cross sections: photoelectric, Compton, Rayleigh, pair production, Bremsstrahlung
 - Shell integrated cross sections: photo-electric, ionization
 - Energy spectra: secondary e- processes

- Validity range (recommended) : **250 eV - 100 GeV**
 - Processes can be used down to 100 eV, with a reduced accuracy
 - In principle, down to ~10 eV

- Included elements from **Z=1 to Z=100**
 - Include atomic effects (fluorescence, Auger)
 - Atomic relaxation : $Z > 5$ (EADL transition data)

- Naming scheme: **G4LivermoreXXXModel** (eg. G4LivermoreComptonModel)

<http://www-nds.iaea.org/epdl97>

Available Livermore **models**

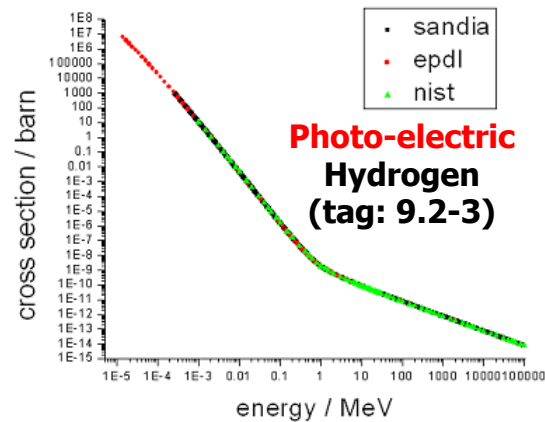

8

Physics Process	Process Class	Model Class	Low Energy Limit	High Energy Limit
Gammas				
Compton	G4ComptonScattering	G4LivermoreComptonModel	250 eV (kill)	100 GeV
Polarized Compton	G4ComptonScattering	G4LivermorePolarizedComptonModel	250 eV (kill)	100 GeV
Rayleigh	G4RayleighScattering	G4LivermoreRayleighModel	10 eV (kill)	100 GeV
Polarized Rayleigh	G4RayleighScattering	G4LivermorePolarizedRayleighModel	250 eV (kill)	100 GeV
Conversion	G4GammaConversion	G4LivermoreGammaConversionModel	1.022 MeV	100 GeV
Polarized Conversion	G4GammaConversion	G4LivermorePolarizedGammaConversionModel	1.022 MeV	100 GeV
Photo-electric	G4PhotoElectricEffect	G4LivermorePhotoElectricModel	~ few eV	100 GeV
Polarized Photo-electric	G4PhotoElectricEffect	G4LivermorePolarizedPhotoElectricModel	10 eV	100 GeV
Electrons				
Ionization	G4eIonisation	G4LivermoreIonisationModel	100 eV	100 GeV
Bremsstrahlung	G4eBremsstrahlung	G4LivermoreBremsstrahlungModel	10 eV	100 GeV

Eg. of **verification** of Livermore models

See Nucl. Instrum. and Meth. A 618 (2010) 315-322

9

9

Polarized Livermore models

10

- Describe in detail the kinematics of **polarized photon interactions**
- Based on the Livermore database
- Possible applications of such developments
 - ▣ **design of space missions** for the detection of polarized photons
- Naming scheme: **G4LivermorePolarizedXXXModel**
 - ▣ eg. G4LivermorePolarizedComptonModel
- More in the following publications

Nucl. Instrum. Meth. A 566 (2006) 590-597 (Photoelectric)
Nucl. Instrum. Meth. A 512 (2003) 619-630 (Compton and Rayleigh)
Nucl. Instrum. Meth. A 452 (2000) 298-305 (Pair production)

Physics 2/7

Penelope models

Penelope physics

12

- Geant4 includes the low-energy models for **electrons**, **positrons** and **photons** from the Monte Carlo code **PENELOPE** (PENetration and Energy LOss of Positrons and Electrons) version **2008**

Nucl. Instrum. Meth. B 207 (2003) 107-123

- Physics models
 - ▣ Specifically developed by the group of F. Salvat et al.
 - ▣ Great care dedicated to the **low-energy** description
 - Atomic effects, fluorescence, Doppler broadening...
- **Mixed** approach: analytical, parameterized & database-driven
 - ▣ Applicability energy range: **100 eV – 1 GeV**
- Also include **positrons**
 - ▣ Not described by Livemore models
- **G4PenelopeXXXModel** (e.g. G4PenelopeComptonModel)

Available Penelope models

13

Physics Process	Process Class	Model Class	Low Energy Limit	High Energy Limit
Gammas				
Compton	G4ComptonScattering	G4PenelopeComptonModel	100 eV	1 GeV
Rayleigh	G4RayleighScattering	G4PenelopeRayleighModel	100 eV	1 GeV
Conversion	G4GammaConversion	G4PenelopeGammaConversionModel	1.022 MeV	1 GeV
Photo-electric	G4PhotoElectricEffect	G4PenelopePhotoElectricModel	100 eV	1 GeV
Electrons/Positrons				
Ionization	G4elonisation	G4PenelopelonisationModel	100 eV	1 GeV
Bremsstrahlung	G4eBremsstrahlung	G4PenelopeBremsstrahlungModel	100 eV	1 GeV
Positrons				
Annihilation	G4eplusAnnihilation	G4PenelopeAnnihilationModel	100 eV	1 GeV

Physics 3/7

Ions

Ion energy loss model

15

- Describes the energy loss of **ions heavier than Helium** due to interactions with atomic shells of target atoms
- This model computes
 - ▣ Cross sections for the discrete production of **delta rays**
 - Delta rays are only produced above the production threshold, which inherently also governs the discrete energy loss of ions
 - ▣ **Restricted electronic stopping powers**, that is the continuous energy loss of ions as they slow down in an absorber
 - Below the production threshold
- Primarily of interest for medical and space applications
- See more in **Nucl. Instrum. Meth. B 268 (2010) 2343-2354**

Ion energy loss model

16

- **Restricted stopping powers** are calculated from
 - $T < T_{\text{Low}}$: **Free electron gas** model
 - $T_{\text{Low}} \leq T \leq T_{\text{High}}$: **parameterization (ICRU'73)** approach
 - $T > T_{\text{High}}$: **Bethe-Bloch formula** (using an effective charge and higher order corrections)

- **ICRU'73** parameterization
 - Large range of ion-materials combination:
 - Incident ions : Li to Ar, and Fe
 - 25 elemental materials, 31 compounds
 - Stopping powers based on the binary theory, effective charge approach for Fe
 - Special case: water
 - Revised ICRU'73 tables by P. Sigmund
 - Mean ionization potential is **78 eV**
 - Energy limits
 - $T_{\text{High}} = 10 \text{ MeV/nucleon}$ (except Fe ions: $T_{\text{H}} = 1 \text{ GeV/nucleon}$)
 - $T_{\text{Low}} = 0.025 \text{ MeV/nucleon}$ (lower boundary of ICRU'73 tables)

How to use the ion model ?

17

- Model name: `G4IonParametrisedLossModel`
- Only applicable to ions with $Z \geq 3$
- Already included in Geant4 EM physics constructors
 - ▣ Low energy EM: `G4EmLivermorePhysics`, `G4EmLivermorePolarizedPhysics`, `G4EmPenelopePhysics`, `G4EmLowEPPhysics`
 - ▣ Standard EM: `G4EmStandard_option3`, `G4EmStandard_option4`
- Designed to be used with the `G4ionlonisation()` process (from the Standard EM category)
 - ▣ Not activated by default when using `G4ionlonisation`
 - ▣ Users can employ this model by using the `SetEmModel` method of the `G4ionlonisation` process
- Restricted to one Geant4 particle type: `G4GenericIon`
 - ▣ The process `G4ionlonisation` is also applicable to alpha particles (`G4Alpha`) and He3 ions (`G4He3`), however the `G4IonParametrisedLossModel` model **must not be activated for these light ions**
 - ▣ Below $Z < 3$, we use `G4BraggModel` (p) or `G4BraggIonModel` (alpha), and `G4BetheBlochModel` with the `G4hlonisation` and `G4ionlonisation` processes

ICRU 73 data tables

18

- The ion model
 - uses ICRU'73 stopping powers, if corresponding ion-material combinations are **covered** by the ICRU'73 report
 - otherwise applies a **Bethe-Bloch based formalism**
- Elemental **materials** are matched to the corresponding ICRU 73 stopping powers by means of the atomic number of the material. The material **name** may be **arbitrary** in this case.
- For **compounds**, ICRU 73 stopping powers are used **if the material name coincides with the name of Geant4 NIST materials**
 - e.g. "G4_WATER"
- For a **list of applicable materials**, refer to the ICRU 73 report
- All needed data files are in the **G4LEDATA** set of data

<http://geant4-dna.org>

Physics 4/7

Geant4-DNA

The Geant4-DNA project

Extending the Geant4 Monte Carlo simulation toolkit for radiobiology

[Geant4-DNA](#) [Software](#) [Physics](#) [Chemistry](#) [Examples & tutorials](#) [Publications](#) [Collaboration](#) [Funding](#)

Welcome to the Internet page of the **Geant4-DNA project**.

The [Geant4](#) Monte Carlo simulation toolkit is being extended with processes for the **modeling of early biological damages induced by ionising radiation at the DNA scale**. Such developments are on-going in the framework of the Geant4-DNA project, initiated in 2000 by the [European Space Agency/ESTEC](#).

On-going developments include

- **Physics** processes in liquid water and other biological materials
- **Physico-chemistry** and **chemistry** processes for water radiolysis
- Molecular **geometries**
- Quantification of **damages** (such as single-strand, double-strand breaks, ...)

Recent posts

The last Geant4 release (9.6+P01) is available for download, see our [Software](#) section.

Geant4 for microdosimetry in radiobiology

20

- History
 - ▣ initiated in 2001 by Petteri Nieminen (European Space Agency / ESTEC) in the framework of the « **Geant4-DNA** » project
- Objective : adapt the **general purpose** Geant4 Monte Carlo toolkit for the **simulation of interactions of radiation with biological systems at the cellular and DNA level** (« microdosimetry for radiobiology »)
- A full multidisciplinary activity of the Geant4 low energy electromagnetic Physics working group, involving physicists, theoreticians, biophysicists...
- Applications :
 - ▣ Radiobiology, radiotherapy and hadrontherapy
 - eg. early prediction of direct & non-direct **DNA strand breaks** from ionising radiation
 - ▣ Radioprotection for human exploration of Solar system
- Dedicated web site & publications : <http://geant4-dna.org>

Geant4 for microdosimetry in radiobiology

21

- Several models are available for the description of physical processes involving e^- , p , H , He , He^+ , He^{2+} , C^{6+} , N^{7+} , O^{8+} , Fe^{26+}
- Include elastic scattering, excitation (electronic + vibrations), ionisation and charge exchange
- For now, these models are valid for liquid water medium only
- Models available in Geant4-DNA
 - ▣ are published in the literature
 - ▣ may be purely analytical or use interpolated cross section data
- They are all discrete processes
 - ▣ See [\\$G4INSTALL/share/Geant4-9.6.2/examples/advanced/dnaphysics](#)
- Can be combined with other EM categories (Standard, LowE - common software design)
 - ▣ See [\\$G4INSTALL/share/Geant4-9.6.2/examples/advanced/microdosimetry](#)

MuElec processes & models

New processes and models for **microelectronics**

24

- Purpose
 - ▣ extend Geant4 with processes and models for the simulation of particle-matter interactions in highly integrated microelectronic components
 - ▣ for **electrons, protons, heavy ions in Silicon**
- They use the same **step-by-step approach** as Geant4-DNA processes and models
 - ▣ Similarly based on the complex dielectric function theory
- Applicable to the « **G4_Si** » NIST material
- Named as « **MuElec** » for **microelectronics**

New processes and models for **microelectronics**

25

□ Processes and models

Physics Process	Process Class	Model Class	Low Energy Limit	High Energy Limit
Electrons				
Elastic scattering	G4MuElecElastic	G4MuElecElasticModel	16.7 eV (kill < 16.7 eV)	100 MeV
Ionization	G4MuElecInelastic	G4MuElecInelasticModel	16.7 eV	100 MeV
Protons and heavy ions				
Ionization	G4MuElecInelastic	G4MuElecInelasticModel	50 keV/u	1 GeV/u

- A dedicated Physics List and a user example will be delivered in G4 10
- Validation range
 - ▣ Electrons: 50 eV – 50 keV
 - ▣ Protons: 50 keV/u – 23 MeV/u

Nucl. Instrum. Meth B 288 (2012) 66 – 73
Nucl. Instrum. Meth B 287 (2012) 124 – 129
IEEE Trans. Nucl. Sci. 59 (2012) 2697 – 2703

26

Physics 6/7

Monash U. models

Improved **Compton** model

27

- Monash U. (J. Brown et al.) recently proposed to **improve Livermore gamma models**
 - ▣ Unpolarized Compton scattering off atomic bound electrons in the relativistic impulse approximation, derived from Livermore Compton model
 - ▣ As an alternative to Compton scattering models (Livermore and Penelope) developed from Ribberfor's Compton scattering framework
 - More accurate Compton **electron ejection direction algorithms below 5 MeV**
 - Special relativistic formalism + energy & momentum conservation, in order to compute
 - Energy and angular distribution of Compton scattered photons off non-stationary atomic bound electrons
 - Energy and ejected angular distributions of Compton electrons

Improved Compton model

28

- Model class is **G4LowEPComptonModel**
- You can register it easily to your Physics list

```
G4ComptonScattering* cs = new G4ComptonScattering;  
cs->SetEmModel(new G4KleinNishinaModel(),1);  
G4VEmModel* theLowEPComptonModel = new G4LowEPComptonModel();  
theLowEPComptonModel->SetHighEnergyLimit(2*MeV);  
cs->AddEmModel(0, theLowEPComptonModel);  
ph->RegisterProcess(cs, particle);
```
- You can also use two Physics constructors
 - ▣ **G4EmLowEPPhysics** – identical to G4EmLivermorePhysics except for Compton
 - ▣ **G4EmStandard_option4** – « best » of Geant4 EM

Physics 7 / 7

Atomic de-excitation

Atomic de-excitation effects

30

- Atomic de-excitation is initiated by other EM processes
 - E.g. : photo-electric effect, Compton, ionisation by e- and ions
 - Leave the atom in an excited state

- EADL data contain transition probabilities
 - **radiative**: fluorescence
 - **non-radiative**:
 - Auger e-: initial and final vacancies in different sub-shells
 - Coster-Kronig e-: identical sub-shells

- Thanks to a common interface ([G4UAtomicDeexcitation](#)), atomic de-excitation is compatible with **both Standard & Low Energy electromagnetic physics categories**
 - See more in X-Ray Spec. 40 (2011) 135-140

Including atomic effects

31

- The activation of atomic deexcitation in a user physics list can be done « by hand » using the `G4EmProcessOptions` class

```
G4EmProcessOptions emOptions;
```

```
emOptions.SetFluo(true); // To activate deexcitation processes and fluorescence
```

```
emOptions.SetAuger(true); // To activate Auger effect if deexcitation is activated
```

```
emOptions.SetPIXE(true); // To activate Particle Induced X-Ray Emission (PIXE)
```

- It is possible to specify the region in which de-excitation is needed

```
emOptions.SetDeexcitationActiveRegion (const G4String& , G4bool, G4bool, G4bool);
```

- ▣ If no Region command is used, by default atomic de-excitation is applied everywhere
- ▣ If any Region is defined, then de-excitation should be applied to the World volume

Including atomic effects

32

- Alternatively, we recommend the usage of physics constructors and Geant4 physics lists, where activation can be easily done directly via UI commands

```
/run/initialize
/process/em/deexcitation region true false false
/process/em/deexcitation region true true true
/process/em/fluor true
/process/em/auger true
/process/em/pixe true
```
- Boolean parameters in the "/process/em/deexcitation" command correspond to activation of fluorescence, Auger, and PIXE respectively
- **region** is the name of the G4Region in which de-excitation should be activated
 - ▣ use the string **World** if the G4Region is the World volume
- Note that **fluorescence is activated by default** in the **G4EmDNAPhysics**, **G4EmLivermorePhysics**, **G4EmLivermorePolarizedPhysics**, **G4EmLowEPPhysics**, **G4EmPenelopePhysics**, **G4EmStandard_option3** and **G4EmStandard_option4** physics constructors while Auger production and PIXE are not
- As an example, look into `$G4INSTALL/share/Geant4-9.6.2/examples/extended/electromagnetic/TestEm5` and macro **pixe.mac**

Note on production thresholds

33

- Remember that production cuts for secondaries are specified as **range cuts**. These are converted at initialisation time into energy thresholds for secondary gamma, electron, positron and proton production.
- A range cut value is set **by default to 0.7 mm** in Geant4 **reference physics lists**. This value can be specified in the optional **SetCuts()** method of the user physics list or via **UI commands** :
 - for eg. to set a range cut of 10 micrometers, one can use `/run/setCut 0.01 mm`
 - or, for a given particle type (for e.g. electron) `/run/setCutForAGivenParticle e- 0.01 mm`
- If a range cut equivalent to an energy **lower than 990 eV** is specified, then **the energy cut is still set to 990 eV**. In order to **decrease this value** (for eg. down to 250 eV, to see low energy emission lines of the fluorescence spectrum), one can use the UI command:

`/cuts/setLowEdge 250 eV`

or alternatively directly in the user physics list, in the optional **SetCuts()** method, using:

`G4ProductionCutsTable::GetProductionCutsTable()->SetEnergyRange(250*eV, 1*GeV);`

- In your macro, these UI commands should be put before the UI command

`/run/initialize`

Changing **shell** cross section models

34

- The user has the possibility to select different ionisation cross section models for PIXE. Again, it is possible to use methods of the `G4EmProcessOptions` class in the user Physics list:

```
G4EmProcessOptions::SetPIXECrossSectionModel(const G4String&);
```

where the string can be "`Empirical`" or "`ECPSSR_FormFactor`" or "`ECPSSR_Analytical`"
- Alternatively, when using the `Geant4 reference physics lists` (and "physics constructors"), the following UI command is available:

```
/process/em/pixeXSmodel value
```

where `value` is equal to `Empirical` or `ECPSSR_FormFactor` or `ECPSSR_Analytical`.
- This UI command should be put after the UI command:

```
/run/initialize
```
- Shell cross sections models are available for K, L and selected M shells:
 - the `Empirical` models are from Paul "reference values" (for protons and alphas for K-Shell) and Orlic empirical model for L shells (only for protons and ions with $Z > 2$);
 - the `ECPSSR_FormFactor` models derive from A. Taborda et al. calculations of ECPSSR values directly from Form Factors and it covers K, L shells in the range 0.1-100 MeV and M shells in the range 0.1-10 MeV;
 - the `ECPSSR_Analytical` models derive from an in-house analytical calculation of the ECPSSR theory.
- The `Empirical models` are the models used by default. Out of the energy boundaries of these models, the "`ECPSSR_Analytical`" models are used. We recommend to use default settings if not sure what to use.
- Note that shell cross section selection is also available for **electrons** via the following **UI command**:
 - ```
/process/em/pixeElecXSmodel Livermore
```
  - ```
/process/em/pixeElecXSmodel Penelope
```

X-Ray Spec. 40 (2011) 127-134
X-Ray Spec. 40 (2011) 135-140

How to implement a Physics list ?

Physics lists

36

- A user can
 - use **reference physics lists** provided with Geant4 (QBBC,)
 - build his/her **own physics list** in his/her application
 - or use already available EM physics constructors

- 1. If you choose to build your own Physics list
 - refer to the Geant4 Low Energy EM working group website, **Processes** section
 - also you may refer to Geant4 examples
 - [\\$G4INSTALL/share/Geant4-9.6.2/examples/extended/electromagnetic/TestEm14](#)

- 2. **Much more safe**: use the available **physics constructors**, these are named as
 - G4Em**Livermore**Physics
 - G4Em**LivermorePolarized**Physics
 - G4Em**Penelope**Physics
 - G4Em**DNA**Physics
 - G4Em**LowEP**Physics

How to use the already available physics constructors ?

37

- These classes derive from the `G4VPhysicsConstructor` abstract base class
- The **source code** for physics list constructors is available in the following directory
 - `$G4SRC/source/physics_list/builders`
- An implementation example of physics list that uses **EM physics constructors** is available in
 - `$G4INSTALL/share/Geant4-9.6.2/examples/extended/electromagnetic/TestEm2`
 - `easy`
 - in the header file of your physics list, declare : `G4VPhysicsConstructor* emPhysicsList;`
 - in the implementation file of your physics list : `emPhysicsList = new G4EmDNAPhysics();`
 - then, in the `ConstructParticle()` method of your physics list, call the `ConstructParticle()` method of `emPhysicsList`
 - and in the `ConstructProcess()` method of your physics list, call the `ConstructProcess()` method of `emPhysicsList`
- If some **hadronic physics** is needed additionally to EM Physics
 - `$G4INSTALL/share/Geant4-9.6.2/examples/extended/electromagnetic/TestEm7`
- These constructors are added to the **Geant4 reference physics lists** via the method `RegisterPhysics (G4VPhysicsConstructor*)`
 - see `$G4SRC/source/physics_list/lists` subdirectory

The Geant4 Low Energy Electromagnetic Physics Working Group

This web site is the **official web site** of the Geant4 collaboration Low Energy Electromagnetic Physics working group.

Purpose

The Geant4 Low Energy Electromagnetic Physics Working Group develops and maintains a set of models to describe the electromagnetic interactions of photons, electrons, hadrons and ions with matter down to very low energies (eV scale), including the **Geant4-DNA project** ([link1](#) - [link2](#) - [link3](#)). Applications of such models range from high energy physics experiments to space science and astrophysics to the medical and biological fields. After several years of separation, these activities now take place in full collaboration with the [Standard Electromagnetic Physics working group](#) of the Geant4 collaboration.

What's new in Geant4 9.6+P01 ? (February 2013)

- [Overview](#) of our most recent developments.
- Version **6.32** of the set of Low Energy electromagnetic data files is required.
- [Bug notification](#) affecting the **G4EmLivermorePhysics** constructor in releases Geant4 9.6 and 9.6P01.

Physics

- [Processes](#) is a link to the catalog of **Geant4 low energy electromagnetic Physics processes** and to other useful information related to these processes.
- [Physics Lists](#) describes **recommended Physics lists** for applications involving low energy electromagnetic Physics processes.
- [Examples](#) recommended for the **usage of Geant4 electromagnetic Physics**.

Tools

- [Geant4 for VMware & VirtualBox](#) is a link to a **ready-to-use software suite allowing you to run entirely freely Geant4 (a so-called Geant4 Virtual Machine) and associated tools on a Windows PC or Mac** under the VMware or VirtualBox software **without software installation needed**.
- Follow [Geant4VM](#) on Twitter for updates.
- Overview of [testing coverage](#)

Support

- [Release notes](#) is a summary of changes in the low energy package for each Geant4 release.
- [User support](#) is a link to the user forum electromagnetic processes category, where you can post your questions.

Communication and tutorials

- [Journal publications](#) lists all publications of the Geant4 collaboration, including electromagnetic Physics. In addition, our publications related to the **Geant4-DNA project** are available from this [page](#).
- Tutorials are announced on the [Geant4 home page](#), in the **Events** and [Past events](#) sections.

Collaborators

- The **official list of Geant4 collaboration members** belonging to this working group for the current year is available from this [page](#).
- [Institutions](#) gives links to Geant4 web sites of institutions involved in this working group.

Our working group is open to any new collaborator. New collaborators will have the possibility to join officially the Geant4 collaboration after significant contribution to this working group and after approval by the Geant4 steering board.

Summary:

when/why to use the “Low Energy” EM models

42

- **Use** Low-Energy models (Livermore or Penelope), as an **alternative** to Standard models, when you:
 - ▣ need **precise treatment of EM showers** and interactions at **low-energy** (keV scale or below)
 - ▣ are interested in **atomic effects**, as fluorescence x-rays, Doppler broadening, etc.
 - ▣ **can afford** a more CPU-intensive simulation
 - ▣ want to **cross-check** another simulation (e.g. with a different Physics List)

- **Do not use** when you are interested in EM physics **> MeV**
 - ▣ same results as Standard EM models
 - ▣ strong performance penalty
